

**LISTING OF THE CLAIMS**

1       **1.** (Original) An engine comprising:

2               a crankshaft;

3               a gearbox output shaft;

4               a gearbox clutch controllably coupling and decoupling the crankshaft to the gearbox  
5       output shaft; and

6               a slipper clutch coupling the gearbox output shaft to a slipper clutch output shaft, wherein  
7       the slipper clutch is a separate structure from the gearbox clutch, and wherein the slipper clutch  
8       provides positive coupling of torque from the gearbox output shaft to the slipper clutch output  
9       shaft and at least some amount of slip in response to back-torque from the slipper clutch output  
10      shaft.

1       **2.** (Original) The engine of claim 1 wherein the slipper clutch comprises:

2               a gear engaged with the crankshaft;

3               a sprag coupling the gear to the slipper clutch shaft and providing engagement of the gear  
4       to the slipper clutch shaft substantially in only a spragged direction of rotation of the gear;

5               a clutch basket;

6               a stack of drive plates and friction plates disposed within the clutch basket;

7               a spring; and

8               a tensioner which adjustably applies tension from the spring against the stack to  
9       determine an amount of back-torque which is transferred from the gear through the slipper clutch  
10      to crankshaft in a freewheeling direction of rotation of the sprag.

1       **3.** (Original) The engine of claim 2 wherein the slipper clutch further comprises:

2               a dynamic adjuster for changing the tension which the tensioner applies.

1       **4.** (Original) The engine of claim 1 wherein the gearbox clutch provides some amount of  
2       slipper function.

1       **5.** (Original) The engine of claim 1 wherein the engine is an internal combustion engine.

1 6. (Original) The engine of claim 1 further comprising a motorcycle powered by the engine.

1 7. (Currently Cancelled)

1 **8.** (Original) A motor vehicle comprising:

2 a chassis;

3 an internal combustion engine coupled to the chassis, the engine including a crankshaft  
4 and an output shaft;

5 a primary clutch coupled to the crankshaft and to the output shaft to controllably couple  
6 and decouple torque from the crankshaft through to the output shaft;

7 a driven wheel rotatably coupled to the chassis and coupled to the output shaft;

8 a slipper clutch, separate from the primary clutch, and coupled to the crankshaft and to  
9 the output shaft to provide (i) a positive sprag engagement of torque from the crankshaft to the  
10 output shaft, and (ii) a slipper engagement limited amount of back-torque from the output shaft  
11 to the crankshaft.

1 9. (Original) The motor vehicle of claim 8 wherein the slipper clutch comprises:

2 a clutch shaft;

3 a gear engaged with the crankshaft;

4 a sprag coupling the gear to the clutch shaft and providing engagement of the gear to the  
5 clutch shaft substantially in only a spragged direction of rotation of the gear;

6 a clutch basket;

7 a stack of drive plates and friction plates disposed within the clutch basket;

8 a spring; and

9 a tensioner which adjustably applies tension from the spring against the stack to  
10 determine an amount of back-torque which is transferred from the gear through the slipper clutch  
11 to crankshaft in a freewheeling direction of rotation of the sprag.

1 10. (Original) The motor vehicle of claim 9 wherein the slipper clutch further comprises:

2 a dynamic adjuster for changing the tension which the tensioner applies.

1 11. (Original) The motor vehicle of claim 9 wherein:

2 the primary clutch is coupled at a first end of the crankshaft; and

3 the slipper clutch is coupled at a second end of the crankshaft.

1 12. (Original) The motor vehicle of claim 11 wherein:

2 the first end of the crankshaft is toward a front of the motor vehicle; and

3 the second end of the crankshaft is toward a back of the motor vehicle.

1 13. (Original) The motor vehicle of claim 11 wherein:

2 the output shaft is substantially perpendicular to the crankshaft; and

3 the slipper clutch includes a bevel gear coupled to a pinion gear on the output shaft.

1 14. (Original) The motor vehicle of claim 8 wherein the motor vehicle is a motorcycle.

1 15. (Original) The motor vehicle of claim 14 wherein:

2 the crankshaft is oriented parallel with a longitudinal axis of the motorcycle.

1 **16.** (Currently Amended) A motorcycle comprising:

2 a frame;

3 an engine coupled to the frame and including a crankshaft and a primary drive output;

4 a primary clutch coupling the crankshaft to the primary drive output;

5 a final output shaft;

6 a rear wheel coupled to the frame and to the final output shaft;

7 a slipper clutch coupling the primary drive output to the final output shaft to provide  
8 positive torque transfer from the primary drive output to the rear wheel, and to control  
9 back-torque transfer from the rear wheel to the primary drive output.

1 17. (Original) The motorcycle of claim 16 wherein:

2 the slipper clutch includes a dynamic adjuster for altering the back-torque transfer.

1 18. (Original) The motorcycle of claim 17 further comprising:

2 a controller coupled to the dynamic adjuster, whereby a rider of the motorcycle may  
3 control the back-torque transfer while riding the motorcycle.

1 19. (Original) The motorcycle of claim 16 wherein:

2 the slipper clutch is coupled to a swingarm of the frame.

1 20. (Original) The motorcycle of claim 19 wherein:

2 a final output shaft of the slipper clutch is coaxial with a swingarm pivot at which the  
3 swingarm is coupled to the frame.

1 21. (Original) The motorcycle of claim 20 wherein:

2 the final output shaft of the slipper clutch comprises a secondary output shaft; and  
3 the slipper clutch includes a slipper clutch shaft which is coupled to and not coaxial with  
4 the secondary output shaft.

1 22. (Original) The motorcycle of claim 21 wherein:

2 the secondary output shaft rides is coupled to the swingarm by bearings which are coaxial  
3 with the swingarm pivot.
